describing many of the most important aspects of lie group theory this book presents the subject in a hands on way rather than concentrating on theorems and proofs the book shows the applications of the material to physical sciences and applied mathematics many examples of lie groups and lie algebras are given throughout the text the relation between lie group theory and algorithms for solving ordinary differential equations is presented and shown to be analogous to the relation between galois groups and algorithms for solving polynomial equations other chapters are devoted to differential geometry relativity electrodynamics and the hydrogen atom problems are given at the end of each chapter so readers can monitor their understanding of the materials this is a fascinating introduction to lie groups for graduate and undergraduate students in physics mathematics and electrical engineering as well as researchers in these fields

this book is designed to provide a path for the reader into an amalgamation of two venerable areas of mathematics dynamical systems and number theory many of the

motivating theorems and conjectures in the new subject of arithmetic dynamics may be viewed as the transposition of classical results in the theory of diophantine equations to the setting of discrete dynamical systems especially to the iteration theory of maps on the projective line and other algebraic varieties although there is no precise dictionary connecting the two areas the reader will gain a flavor of the correspondence from the following associations diophantine equations dynamical systems rational and integral rational and integral points on varieties points in orbits torsion points on periodic and preperiodic abelian varieties points of rational maps there are a variety of topics covered in this volume but inevitably the choice reflects the author's tastes and interests many related areas that also fall under the heading of arithmetic or algebraic dynamics have been omitted in order to keep the book to a manageable length a brief list of some of these omitted topics may be found in the introduction online resources the reader will find additional material references and errata at [math.brown.edu/jhs/adshome.html](http://math.brown.edu/jhs/adshome.html) acknowledgments the author has consulted a great many sources in writing this book every attempt has been made to give proper attribution for all but the most standard results

the two volume set ccis 143 and ccis 144 constitutes the refereed proceedings of the international conference on electronic commerce application and communication ecwac 2011 held in guangzhou china in april 2011 the 148 revised full papers presented in both volumes were carefully reviewed and selected from a large number of submissions providing a forum for engineers scientists researchers in electronic commerce application and communication fields the conference will put special focus also on aspects such as e business e learning and e security intelligent information applications database and system security image and video signal processing pattern recognition information science industrial automation process control user machine systems security integrity and protection as well as mobile and multimedia communications

probability measures on algebraic topological structures such as topological semi groups groups and vector spaces have become of increasing importance in recent years for

probabilists interested in the structural aspects of the theory as well as for analysts aiming at applications within the scope of probability theory in order to obtain a natural framework for a first systematic presentation of the most developed part of the work done in the field we restrict ourselves to probability measures on locally compact groups at the same time we stress the non abelian aspect thus the book is concerned with a set of problems which can be regarded either from the probabilistic or from the harmonic analytic point of view in fact it seems to be the synthesis of these two viewpoints the initial inspiration coming from probability and the refined techniques from harmonic analysis which made this newly established subject so fascinating the goal of the presentation is to give a fairly complete treatment of the central limit problem for probability measures on a locally compact group in analogy to the classical theory the discussion is centered around the infinitely divisible probability measures on the group and their relationship to the convergence of infinitesimal triangular systems
